

The term “antitumor immunity” refers to innate and adaptive [immune responses](#) that lead to tumor control.

An apparent [paradox](#) exists between the evidence for spontaneous systemic [T cell](#)-mediated anti-tumor [immune responses](#) in [cancer](#) patients, observed particularly in their [bone marrow](#), and local [tumor growth](#) in the periphery. This phenomenon, known as “[concomitant immunity](#)” suggests that the local tumor and it's [tumor microenvironment](#) (TME) prevent systemic [antitumor immunity](#) to become effective.
