

# Autologous formalin-fixed tumor vaccine

## Case reports

A 32-year-old man presented with left facial numbness and right hemiparesis and was referred to our department. MRI and open biopsy indicated brainstem glioma, and he was specifically diagnosed with isocitrate dehydrogenase 1-mutant diffuse astrocytoma of WHO grade II. He was treated with stereotactic radiotherapy followed by [autologous formalin-fixed tumor vaccine](#) (AFTV) three months later. MRI conducted at 42 months after the combination therapy showed a 91% decrease in tumor volume, and the regression was maintained for 5 years. Thus, combination treatment with radiotherapy and immunotherapy may prove to be a promising alternative for the treatment of brainstem glioma <sup>1)</sup>.
