

# Bilateral Chronic Subdural Hematoma Clinical Features

Bilateral Chronic Subdural Hematoma showed different clinical characteristics from unilateral CSDH. Bilateral CSDH is prone to occurrence in the patient of old and diabetics. The patients of bilateral CSDH seem to reveal worse mental status and neurologic sign than unilateral CSDH in both baseline and postoperative state <sup>1)</sup>

The presenting symptoms are those of raised intracranial pressure and mass effect.

The frequency of focal neurological deficits was found to be lesser in patients with bilateral CSDH, and it may confound the diagnosis and delay treatment <sup>2)</sup>.
