

Breast cancer classification

There is a recognition that [breast cancer](#) is a collection of heterogeneous diseases divided into subtypes based on combined [molecular](#) features such as [hormone receptors](#) (HR) and [human epidermal growth factor receptor 2](#) (HER2) status.

The current molecular classification divides breast cancer into five groups luminal A, luminal B, HER-2, basal and normal breast-like. Further grouping of these subgroups seems possible and necessary.

HER2-positive breast cancer

[HER2-positive breast cancer](#)

Triple-negative breast cancer

[Triple-negative breast cancer](#).
