

Cerebral blood volume

150 ml.

Quantitative measurement of [cerebral blood volume](#) (CBV, defined as ml blood in 100 ml brain) is useful for advancing our understanding of [brain physiology](#) and [pathophysiology](#) ¹⁾ ²⁾.

[Perfusion computed tomography](#) (CT) is a technique that allows rapid qualitative and quantitative evaluation of [cerebral perfusion](#) by generating maps of [cerebral blood flow](#) (CBF), [cerebral blood volume](#) (CBV), and [mean transit time](#) (MTT).

see [Relative cerebral blood volume](#).

Studies found significantly higher median CBV ($p = 0.00003$, ANOVA) and lower median ADC in contrast-enhancing areas of glioblastomas, compared to astrocytomas and oligodendrogiomas ($p = 0.41333$, ANOVA). Interestingly, molecularly defined glioblastoma, which usually does not contain contrast-enhancing areas, also shows significantly higher CBV values in the non-enhancing tumor than common glioblastoma and astrocytoma grade 4 ($p = 0.01309$, ANOVA).

Advanced imaging shows promise in visualizing tumor biology and improving the diagnosis of brain tumor patients ³⁾
