The treatment options for glioma in the [cingulate gyrus](#) will depend on various factors, such as the tumor's size, location, grade, and the patient's overall health. Treatment plans may vary from person to person and may include a combination of surgery, radiation therapy, and chemotherapy.

Surgery is the primary treatment option for gliomas. However, in the case of a glioma located in the cingulate gyrus, surgery may be difficult due to the region's proximity to critical areas of the brain that control movement and sensation. In some cases, surgeons may opt for a biopsy to confirm the diagnosis rather than attempting to remove the entire tumor.

Radiation therapy uses high-energy radiation to kill cancer cells and is often used after surgery to kill any remaining cancer cells. Chemotherapy involves the use of drugs that kill cancer cells and is typically used for high-grade gliomas.

Surgery

see [Cingulate gyrus surgery](#).
