

Coagulase is a protein enzyme produced by several microorganisms that enables the conversion of fibrinogen to fibrin. In the laboratory, it is used to distinguish between different types of *Staphylococcus* isolates. Importantly, *S. aureus* is generally coagulase-positive, meaning that coagulase negativity usually excludes *S. aureus*. However it is now known that not all *S. aureus* are coagulase-positive.

see [Coagulase negative staphylococcus](#).
