

Cranial CSF fistula

Key concepts

- suspect in posttraumatic [otorrhea/rhinorrhea](#) or recurrent meningitis
- management strategy:
 - 1) confirm the [fluid](#) is [CSF](#)
 - 2) identify the site of origin of the [leak](#)
 - 3) determine the [etiology/mechanism](#)
- most bedside tests are unreliable and include: “reservoir sign,” target/halo sign, qualitative [glucose](#)
- the most accurate confirmatory test is β 2-[transferrin](#)
- CT [cisternography](#) is the test of choice for localizing site of the fistula

Non-traumatic CSF leak may be spontaneous in the absence of obvious cause, such as skull base abnormalities or bone erosion related to tumors or hydrocephalus ^{[1\)](#) [2\)](#) [3\)](#)}.
