

A 63-year-old male who complained of a four-week-long “tingling and numbness” in his right upper and lower extremities. The sensation worsened over the next couple of days to the point where it affected his gait and led to a subsequent visit to the emergency room. Initial presentation prompted a stroke workup, but further investigation revealed findings suggestive of CSM. This case report highlights the symptomology of cervical spondylotic myelopathy in adults greater than 50 years of age and emphasizes the importance of recognizing the essential markers of this condition ¹⁾.
