

The digastric muscle (also digastricus) (named digastric as it has two 'bellies') is a small muscle located under the jaw. The term "digastric muscle" refers to this specific muscle. However, other muscles that have two separate muscle bellies include the ligament of Treitz, omohyoid, occipitofrontalis.

It lies below the body of the mandible, and extends, in a curved form, from the mastoid process to the symphysis menti. It belongs to the suprathyroid muscles group.

A broad aponeurotic layer is given off from the tendon of the digastricus on either side, to be attached to the body and greater cornu of the hyoid bone; this is termed the suprathyroid aponeurosis.

DM: [Digastric muscle](#); EAC: [External auditory canal](#); IOM: [Obliquus capitis inferior muscle](#); LEM: [levator scapulae muscle](#); MP: [mastoid process](#); SOM: [Obliquus capitis superior muscle](#).
