

Drug screening

Zhu et al. reported a medium-throughput drug-screening platform (METPlatform) based on organotypic cultures that allow evaluating inhibitors against [metastases](#) growing in situ. By applying this approach to the unmet clinical need of [brain metastases](#), they identified several vulnerabilities. Among them, a [blood-brain barrier](#) permeable [HSP90](#) inhibitor showed high potency against mouse and human brain metastases at clinically relevant stages of the disease, including a novel model of local relapse after neurosurgery. Furthermore, *in situ* proteomic analysis applied to metastases treated with the chaperone inhibitor uncovered a novel molecular program in brain metastasis, which includes biomarkers of poor prognosis and actionable mechanisms of resistance. The work validates METPlatform as a potent resource for metastasis research integrating [drug screening](#) and unbiased omic approaches that are compatible with human samples. Thus, this clinically relevant strategy is aimed to personalize the management of metastatic disease in the brain and elsewhere ¹⁾.
