Los *ependimomas anapláxicos* corticales son lesiones extremadamente raras conociéndose solo 7 casos antes del 2011. Se asocia con un historial de convulsiones. Su relación con el *glioma angiocéntrico* descrito recientemente, se sigue debatiendo (Van Gompel y col., 2011). Rara vez, el *ependimoma cortical* puede presentarse como una lesión en alas de mariposa y debe ser considerada en el diagnóstico diferencial de estas lesiones en los adultos (Ng y col., 2012). **Bibliografía** Ng, David W K, Nicolas K K King, Aaron S C Foo, Yih-Yian Sitoh, Hwei Yee Lee, and Wai Hoe Ng. 2012. "Anaplastic Supratentorial Cortical Ependymoma Presenting as a Butterfly Lesion." *Surgical Neurology International* 3: 107. doi:10.4103/2152-7806.101001. .
