

[Revascularization](#) surgeries seemed to demonstrate a higher risk of [wound](#)-related complications. Double-type procedures, which use both branches of the [superficial temporal artery](#) (STA), and a history of [Diabetes Mellitus](#) (DM) were found to be risk factors for wound-related complications. Attention should be paid to the design of the galeal incision and vessel harvest line. Also, special attention should be paid to patients with DM ¹⁾.
