

Focal seizure

Focal [seizures](#) can arise from coordinated activity across large-scale epileptic networks and propagate to regions that are not functionally altered but are recruited by epileptiform discharges.

[Focal seizure](#) may evolve to bilateral tonic-clonic (previously called secondary-generalized). Atonic, clonic, tonic, [myoclonic seizures](#) and [epileptic spasms](#) can be either of focal or generalized onset. Unclassified type of seizure was introduced. New types of seizures (absence with [eyelid myoclonia](#), myoclonic absence, myoclonic atonic and clonic-tonic-clonic seizures) were added ¹⁾.

see [Focal epilepsy](#).
