

Framingham Risk Score

The Framingham Risk Score (FRS) is a gender-specific algorithm used to estimate the 10-year cardiovascular risk of an individual. The Framingham Risk Score was first developed based on data obtained from the Framingham Heart Study, to estimate the 10-year risk of developing coronary heart disease.

FRS, [diabetes mellitus](#), and [aneurysm size](#) as predictors of atherosclerosis in patients undergoing aneurysm surgery can be helpful guides for surgical decisions and methods ¹⁾.
