Advances in glioblastoma diagnosis and glioblastoma surgery mean that radical resections can be performed even in eloquent brain areas. However, patients not indicated for resection will experience a major reduction in life expectancy. Patients who underwent stereotactic biopsy and received some form of oncological treatment experienced slightly increased overall survival relative to patients with a natural disease course. Patients with favorable clinical factors reacted better to treatment ¹⁾

Overall survival

Glioblastoma overall survival.

Glioblastoma patients who were readmitted within 30 days had significantly shorter survival than nonreadmitted patients. Future studies that attempt to decrease readmissions and evaluate the impact of reducing readmissions on patient outcomes are needed ²⁾.

Despite advances in treatment, the median patient survival is 12 to 15 months ³⁾.

Glioblastoma progression

Glioblastoma progression.
