

Glossopharyngeal Cochlear Triangle

The [far lateral transcondylar craniotomy](#) is the standard approach for [posterior inferior cerebellar artery aneurysm](#) exposure through the microsurgical dissection in the [vagoaccessory triangle \(VAT\)](#). However, the extended [retrosigmoid craniotomy](#) and dissection through the [glossopharyngeal-cochlear triangle \(GCT\)](#) may be more appropriate when the patient has an aneurysm arising from a high-riding [vertebral artery](#) (VA)-PICA origin.
