

# Intracranial arachnoid cyst classification

Intracranial [arachnoid cyst](#) can be classified as primary developmental cysts or secondary cysts. Primary cysts arise from the splitting of the [arachnoid membranes](#) in utero, resulting in the development of anomalous collections of cerebrospinal fluid (CSF). Secondary cysts are less common, often appearing after trauma, surgery, infection, or intracranial hemorrhage.

## Localization

Intracranial cysts are classified as supratentorial, infratentorial, and supra-infratentorial (tentorial notch) <sup>1)</sup>.

50-66% occurring within the middle cranial fossa in most series. Ten percent occur in the suprasellar and quadrigeminal regions and approximately 5% each in the posterior fossa and over the frontal convexities.

### Supratentorial arachnoid cyst

see [Supratentorial arachnoid cyst](#).

[Ventricle Arachnoid Cyst](#)

### Infratentorial

see [Posterior fossa arachnoid cyst](#).
