

# Magnetoelectric Nanoparticles

Electrostimulation is regarded pivotal to promote repair of nerve injury, however, failed to get extensive application *in vivo* due to the challenges in noninvasive electrical loading accompanying with construction of biomimetic cell niche.

Zhang et al. demonstrated a new concept of magneto responsive electric 3D matrix for remote and wireless Electrostimulation. By the preparation of magnetoelectric core/shell structured Fe<sub>3</sub>O<sub>4</sub> @BaTiO<sub>3</sub> NPs-loaded hyaluronan/collagen hydrogels, which recapitulate considerable magnetoelectricity and vital features of native neural extracellular matrix, the enhancement of neurogenesis both in cellular level and spinal cord injury *in vivo* with external pulsed magnetic field applied is proved. The findings pave the way for a novel class of remote controlling and delivering electricity through extracellular niches-mimicked hydrogel network, arising prospects not only in neurogenesis but also in human-computer interaction with higher resolution <sup>1)</sup>.
