

# McGregor's line

The McGregor line is a modification of the Chamberlain's line and is used in the evaluation of **basilar invagination** when the **opisthion** is not identified on plain **radiography**.

It refers to a line connecting posterior edge of the **hard palate** to the most caudal point of the occipital curve. If the tip of the **dens** lies more than 4.5 mm above this line it is indicative of **basilar invagination**.

The slope of the line of sight and **McGregor's line** (McGS) correlated strongly with **Chin brow vertical angle** (CBVA) and can be used as surrogate measures. The range of values for these measures corresponding to low disability was identified. These values can be used as a general **guideline** to assess alignment for diagnostic purposes. Cervical compensatory mechanism may modify the natural head position in sagittally misaligned patients <sup>1)</sup>.
