

Meningioma en plaque

Meningioma en plaque (MEP) is rare characterized more by its clinical and biological behavior than its histological appearance.

It represents a morphological subgroup within the meningiomas defined by a carpet or sheet-like lesion that infiltrates the **dura** and sometimes invades the **bone**.

Hyperostosis of the **skull** is one of the characteristic signs of MEP. This bony change can produce clinical symptoms and signs in MEP by pressing against adjacent structures ¹⁾.

Differential diagnosis includes **fibrous dysplasia**, osteoma, and osteoblastic metastasis.
