

Microparticle

see [Extracellular vesicle](#)

Microparticles (MP) are small vesicular micro-molecules released by red and white [blood cells](#), [platelets](#) and [endothelial cells](#) that can change rapidly and specifically depending on the type of cellular insult. They may serve as useful tools to target a specific pool of [proteins](#) associated with the development of [cerebral vasospasm](#) (CV) post aSAH.

These and other proteins may be useful as reliable biomarkers to guide in stratifying patients into categories of risk to develop [cerebral vasospasm](#) (CV) post aSAH. These results will deepen our understanding of the mechanisms of cerebral vasospasm and potentially facilitate the development of safer and more effective therapies for cerebral vasospasm ^{[1\)](#)}
