

The deepgoing role of [Long non-coding RNA](#) (lncRNAs) on [meningioma](#) is still unclear.

Xing et al., investigated the roles of lncRNA [LINC00460](#) in meningioma tissue and uncover its molecular mechanism. Results revealed that LINC00460 expression level was significantly up-regulated in meningioma tissues and malignant meningioma cell lines (IOMM-Lee, CH157-MN). Mechanically, loss-of-function assays showed that LINC00460 knockdown significantly suppressed the proliferation ability, increased the apoptosis and decreased the proteins (MMP-2, MMP-9, ZEB1) expression. Bioinformatics tools predicted that [miR 539](#) both targeted with the 3'-UTR of LINC00460 and MMP-9 mRNA, which was confirmed by luciferase reporter assay and western blot analysis. In summary, our study reveals that LINC00460 promotes MMP-9 expression through targeting miR-539, acting as an oncogenic RNA in the meningeoma malignancy and accelerating the proliferation and metastasis of meningeoma ¹⁾.
