

Modern society, or modernity, is defined as people living together in the current time. An example of modern society is the current political, sociological, scientific and artistic climate.

Overeating is a serious issue in [modern society](#), causing many [health](#) problems, including [obesity](#). Although the [hypothalamus](#) has been previously identified as the key brain structure that regulates body weight [homeostasis](#), the downstream pathways and non-canonical neural circuitry involved in feeding behavior remain largely uncharacterized.

Hao et al. discovered that suppressing the activity of [GABAergic](#) cells in the anterior ventrolateral periaqueductal gray (vIPAG), whether directly or through long-projection GABAergic inputs from either the bed nucleus of the [stria terminalis](#) (BNST) or the lateral [hypothalamus](#) (LH), is sufficient to promptly induce feeding behavior in well-fed mice. In contrast, optogenetic activation of these cells interrupts food intake in starved mice. Long-term chemogenetic manipulation of vIPAG GABAergic cell activity elicits a corresponding change in mouse body weight. Our studies reveal distinct midbrain GABAergic pathways and highlight an important role of GABAergic cells in the anterior vIPAG in feeding behavior ¹⁾.
