

Operculum

The operculum, defined as the cortex adjacent to the [insula](#), is a large structure encompassing three lobes, with a recognized role in a variety of neurologic and psychiatric conditions.

The operculum can be divided into frontal, parietal, and temporal regions, after the lobes of which they form a part. The part of the operculum on the precentral and postcentral gyri, on either side of the central sulcus (or “Rolandic fissure”), is known as the Rolandic operculum.

Frontal operculum

see [Pars opercularis](#).

see [Operculum glioma](#).

Function

see [Operculum Function](#).
