

Parasellar epidermoid cyst

Case reports

Shaw et al. present a case of a parasellar [epidermoid cyst](#) which has ruptured into the nasopharynx; to the best of their knowledge, this has not been previously reported. The computed tomography (CT) and magnetic resonance imaging (MRI) are presented. The pathology and radiological features of epidermoid tumours are discussed, particularly in relation to extracranial connections. The differential diagnosis of lesions eroding the central skull base is reviewed ¹⁾.
