

Pedicle screw pull-out strength is determined in part by the major [screw](#) diameter which should be 70–80% of [pedicle](#) diameter (in adults, larger screws can break through the [pedicle wall](#) or can burst the pedicle; in peds, larger screws may be used as the pedicle can expand). The minor diameter determines the strength of the screw and should be \geq 5.5 mm in the adult [lumbar spine](#).
