

# Positive Fluid Balance

A positive [fluid balance](#) indicates that the patient's fluid input is higher than their output.

---

In critically ill patients with traumatic brain injury, there is significant variability in fluid management, with more [positive fluid balances](#) being associated with worse outcomes. These results, when added to previous evidence, suggest that aiming for neutral fluid balances, indicating a state of [normovolemia](#), contributes to improved outcome <sup>1)</sup>.

---

Restrictive fluid management can reduce cerebral edema and improve the prognosis but does not affect the 28-day mortality of patients with sTBI <sup>2)</sup>

---

Greater positive net fluid balance is independently associated with poorer functional outcome in patients with aSAH <sup>3)</sup>.
