

The [prothrombin time \(PT\)](#)—along with its derived measures of prothrombin ratio (PR) and [international normalized ratio \(INR\)](#)—are assayed evaluating the extrinsic pathway of coagulation. This test is also called “ProTime INR” and “PT/INR”. They are used to determine the [clotting](#) tendency of [blood](#), in the measure of [warfarin](#) dosage, liver damage, and [vitamin K](#) status. PT measures factors I ([Fibrinogen](#)), II ([Prothrombin](#)), V ([Proaccelerin](#)), VII ([Proconvertin](#)), and X (Stuart–Prower Factor). It is used in conjunction with the [activated partial thromboplastin time \(aPTT\)](#) which measures the intrinsic pathway and common pathway.
