

q4207

73-year-old patient, admitted for a infiltrative [lesion](#) highly suggestive of [Primary leptomeningeal lymphoma](#).

Past Medical History

[Hypercholesterolemia](#)

[Depression](#)

[Hydrocephalus](#). [Endoscopic third ventriculostomy](#)

Treatment

[Simvastatin](#)

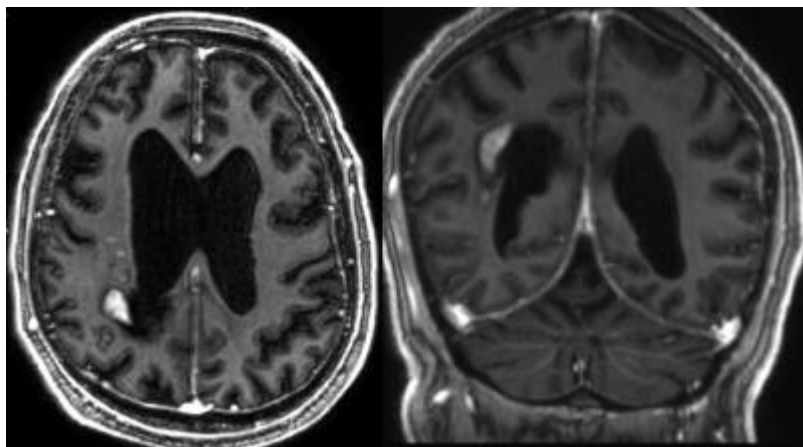

[Desvenlafaxine](#).

History of the present illness

Abnormal [gait](#) with [instability](#) and a feeling of magnetism in it, accompanied by [bradypsychia](#) and occasional [memory](#) failures.

Test results

MRI

Regarding the last previous control, there are no significant variations, however, when comparing the evolution of the previous studies over the last 2 years, a constant progression is identified both in

FLAIR and in the diffusion of [periventricular](#) predominance, especially at the right [parietal](#) level, with involvement of the [splenium](#) of the [corpus callosum](#) and in the right hemi[protuberance](#) in the last 2 studies, both in diffusion and in FLAIR, with a progressive increase in uptake, without clear images of [mass effect](#) at the current time. The lesion is highly suggestive of lymphoma.
