

Sensitization

Sensitization is a non-associative learning process in which repeated administration of a stimulus results in the progressive amplification of a response.

Sensitization often is characterized by an enhancement of response to a whole class of stimuli in addition to the one that is repeated. For example, repetition of a painful stimulus may make one more responsive to a loud noise. Try to find most tortuous, longest strangest path selection and that sensitize that 80%-95% transaction low coverage in the flow testing.
