

Spinal Cord Injury Classification

Spinal cord injury (SCI) is classified based on **neurological level**, **completeness**, and **severity** using the **ASIA (American Spinal Injury Association) Impairment Scale (AIS)**.

1. Neurological Level of Injury (NLI)

- The **lowest** spinal segment with normal sensory and motor function on both sides of the body. - Tested segment-by-segment:

- Sensory: Dermatome testing
- Motor: Myotome testing

2. Completeness of Injury

- **Complete injury**: No sensory or motor function is preserved in sacral segments (S4-S5). - **Incomplete injury**: Some sensory or motor function preserved below the injury level, including sacral segments.

3. ASIA Impairment Scale (AIS)

| Grade | Description |
|----------|-------------------------------------------------------------------------------------------------|
| A | Complete: No motor or sensory function in S4-S5. |
| B | Sensory Incomplete: Sensory but not motor function preserved below the level, including S4-S5. |
| C | Motor Incomplete: Motor function preserved; more than half of key muscles have muscle grade <3. |
| D | Motor Incomplete: Motor function preserved; at least half of key muscles have muscle grade ≥3. |
| E | Normal: Motor and sensory functions are normal. |

4. Zone of Partial Preservation (ZPP)

- Only used in **complete injuries** (AIS A). - Refers to dermatomes and myotomes below the neurological level that retain some function.

Notes

You can expand the examination by adding:

- Standard sensory key points
- Standard motor key muscles

- Reflex testing
 - Deep anal sensation and voluntary anal contraction (for sacral sparing)
