

A spine center is a medical facility that specializes in the diagnosis, treatment, and management of spine-related disorders and conditions. These centers typically have a multidisciplinary team of healthcare professionals, including spine surgeons, orthopedic surgeons, neurologists, physical therapists, and pain management specialists, who work together to provide comprehensive care for patients with spine-related issues.

Spine centers may offer a wide range of diagnostic and treatment options, including physical therapy, chiropractic care, medication management, spinal injections, minimally invasive spine surgery, and complex spine surgery. The specific services offered may vary depending on the individual center and the expertise of its healthcare providers.

Spine centers may be located within larger medical facilities, such as hospitals or outpatient clinics, or they may be standalone facilities dedicated solely to spine care. They may also work closely with other healthcare providers and specialists, such as primary care physicians, rheumatologists, and oncologists, to ensure that patients receive comprehensive care that addresses all of their medical needs
