

Super refractory status epilepticus treatment

The treatment [protocol](#) for [refractory status epilepticus](#) is intensive and includes [benzodiazepines](#), [anticonvulsants](#), and eventually [anesthetics](#) for [induced coma](#) when polypharmacy is exhausted ^{[1\)](#)}.

If seizures continue or recur after 24 hours following treatment with anesthetics, it is termed super refractory [status epilepticus](#) (SRSE). Because of high [mortality](#) with polypharmacy and continuous [anesthetic](#) use, there has been a great interest to use nonmedicinal devices like VNS ^{[2\)](#)}.
