

The [inferior vermis](#) lies in a deep vertical depression in the [suboccipital](#) surface called the [posterior cerebellar incisura](#), which also contains the [falx cerebelli](#). The [inferior vermis](#) forms the posterior cortical surface within this [incisura](#). In contrast, the [superior vermis](#) is the highest point on the [cerebellum](#), occupying the space under the [straight sinus](#) where the tentorial leaflets intersect with the [falx cerebri](#). The superior vermis slopes downward from its apex anteriorly to the posterior cerebellar incisura. The tentorial part of the vermian surface includes (from anterior to posterior) the [culmen](#), [declive](#), and [folium](#). The suboccipital part of the vermian surface includes (from superior to inferior) the [tuber](#), [pyramid](#), [uvula](#), and [nodule](#). The nodule is hidden deep to the uvula.
