

Synucleinopathy

Synucleinopathies (also called α -Synucleinopathies) are [neurodegenerative diseases](#) characterized by the abnormal accumulation of aggregates of alpha-synuclein protein in [neurons](#), nerve fibers or glial cells.

There are three main types of synucleinopathy: [Parkinson's disease](#) (PD), [dementia with Lewy bodies](#) (DLB), and [multiple system atrophy](#) (MSA).

Other rare disorders, such as various neuroaxonal dystrophies, also have α -synuclein pathologies.

Synucleinopathies-related disorders such as Lewy body dementia (LBD) and Isolated [REM sleep behavior disorder](#) (iRBD) have been associated with [neuroinflammation](#). Yu et al. examined whether the human leukocyte antigen ([HLA](#)) locus plays a role in iRBD and LBD. In iRBD, HLA-DRB1*11:01 was the only allele passing FDR correction (OR = 1.57, 95% CI = 1.27-1.93, p = 2.70e-05). We also discovered associations between iRBD and HLA-DRB1 70D (OR = 1.26, 95%CI = 1.12-1.41, p = 8.76e-05), 70Q (OR = 0.81, 95%CI = 0.72-0.91, p = 3.65e-04) and 71R (OR = 1.21, 95%CI = 1.08-1.35, p = 1.35e-03). Position 71 (pomnibus = 0.00102) and 70 (pomnibus = 0.00125) were associated with iRBD. The results suggest that the HLA locus may have different roles across [synucleinopathy](#)¹⁾
