

Thoracic disc herniation clinical features

- Lumbar angiomatic meningioma: how to manage this rare entity? A case report
- Outcomes of non-limited versus cranial-limited extensive hemilaminectomy and durotomy in dogs with thoracolumbar intervertebral disc extrusion and presumptive progressive myelomalacia
- The role of spinal cord neuroanatomy and the variances of epidurally evoked spinal responses
- Thoracolumbar hydrated nucleus pulposus extrusion and intervertebral disc extrusion in dogs: Comparison of clinical presentation and magnetic resonance imaging findings
- Clinical and radiographic features of adult calcified thoracic disc herniation: a retrospective analysis of 31 cases
- Efficacy and Clinical Outcomes of Minimally Invasive Direct Thoracic Interbody Fusion: A Retrospective Analysis
- Spontaneous correction of scoliosis after curettage of spinal osteoid osteoma: How and when?
- Study on diagnosis and treatment of lumbar disc herniation and related factors based on dynamic electromyography

Most common symptoms: [pain](#) (60%), sensory changes (23%), motor changes (18%). With thoracic [radiculopathy](#), pain and sensory disturbance is in a band-like distribution radiating anteriorly and inferiorly along the involved root's [dermatome](#). Motor involvement is difficult to document.

see [Thoracic discogenic pain syndrome](#)

see [Pain in thoracic disc herniation](#).

A 57 year- old man with lateral [abdominal wall bulging](#). [MRI](#) showed thoracic [disk herniation](#) at the T11-T12 level. Needle [electromyogram](#) disclosed acute [denervation](#) in paraspinal and [abdominal muscles](#) innervated from [thoracic spinal nerve 11](#). Eight months later the swelling was reduced significantly. [Thoracic disc herniations](#) are rare and three similar cases have been described previously ¹⁾.
