Thoracic spinal cord ependymomas are [intramedullary tumors](#) that arise from the [ependymal](#) cells lining the central canal of the [spinal cord](#). They are the most common [intramedullary spinal cord tumors](#) in [adults](#) and frequently occur in the [thoracic region](#).

In a operative video manuscript, [James K. Liu](#) from the Departments of Neurological Surgery and Otolaryngology-Head and Neck Surgery, Center for Skull Base and Pituitary Surgery, Neurological Institute of [New Jersey](#), demonstrates an illustrative step-by-step technique for microsurgical resection of a thoracic intramedullary [spinal cord ependymoma](#) (T-3 to T-5) associated with an extensive cervicothoracic [syrinx](#). The application of a handheld non-contact [CO2 laser](#) for performing the midline [myelotomy](#) is also highlighted. The [operative technique](#) and surgical nuances, including the surgical approach, intradural tumor removal, and closure, are illustrated in this video atlas. The video can be found here: <http://youtu.be/itE2tuBFmgw>¹⁾.
