

Thromboembolic disease

The main concern with the use of the [pipeline embolization device](#) (PED) in treating cerebral aneurysms is the risk of hemorrhagic and [thromboembolism](#), including several cases of branch artery occlusion and delayed occlusion of the stented parent vessel shortly after antiplatelet medications were discontinued, highlighting the potential need for long-term antiplatelet therapy, and disastrous bleeding complications in unruptured aneurysm.

see [Venous thromboembolism](#)
