

# Transcranial magnetic stimulation

Transcranial magnetic stimulation (TMS) is a unique [method](#) for non-invasive brain [imaging](#). The fundamental difference between TMS and other available non-invasive brain imaging techniques is that when a physiological response is evoked by stimulation of a cortical area, that specific cortical area is causally related to the response. With other imaging methods, it is only possible to detect and map a brain area that participates in a given task or reaction.

## Transcranial magnetic stimulation tractography

[Transcranial magnetic stimulation tractography](#)

## Indications

see [Repetitive transcranial magnetic stimulation](#).

Brain tumor resections in presumed eloquent location <sup>[1\)](#) [2\)](#)</sup>

see [Navigated transcranial magnetic stimulation](#).

see [Transcranial direct current stimulation](#).
