

Tyrosine hydroxylase

Energy homeostasis, food intake, and body weight are regulated by specific brain circuits.

Data support the view that [arcuate nucleus](#) (ARC) [tyrosine hydroxylase](#) (TH) cells play an unrecognized and influential positive role in energy homeostasis ¹⁾.

Cai et al., demonstrated that basic [fibroblast growth factor](#) (bFGF), as a neurotropic factor, inhibited Endoplasmic reticulum (ER) stress-induced neuronal cell [apoptosis](#) and that 6-hydroxydopamine (6-OHDA)-induced ER stress was involved in the progression of [Parkinson's disease](#) (PD) in rats. bFGF administration improved motor function recovery, increased tyrosine hydroxylase (TH)-positive neuron survival, and upregulated the levels of [neurotransmitters](#) in PD rats.

The 6-OHDA-induced ER stress response proteins were inhibited by bFGF treatment. Meanwhile, bFGF also increased expression of TH. The administration of bFGF activated the downstream signals PI3K/Akt and Erk1/2 in vivo and in vitro. Inhibition of the PI3K/Akt and Erk1/2 pathways by specific inhibitors partially reduced the protective effect of bFGF. This study provides new insight towards bFGF translational drug development for PD involving the regulation of ER stress ²⁾.
