

Venous sinus stenting

Venous sinus stenting is an emerging treatment for patients with idiopathic intracranial hypertension and evidence of venous stenosis. Stents placed across the transverse and sigmoid sinuses often cover the vein of Labb   (VOL), a major anastomotic vein draining the cerebral hemisphere.

In the majority of venous stenting cases involving the transverse and sigmoid sinuses, the VOL remains widely patent. Complete VOL occlusion rarely occurs after stenting and may not result in clinical sequelae. Stent coverage of the VOL should not deter the therapeutic use of venous sinus stenting ¹⁾.

Venous sinus stenting for Idiopathic Intracranial Hypertension treatment
