

Vertebral compression fracture treatment

see also [Thoracolumbar spine fracture treatment](#).

see also [Thoracolumbar spine fracture surgery indications](#).

In the majority of cases, the method of treatment is [percutaneous vertebroplasty](#) (PV) or [kyphoplasty](#) (PK).

The [transpedicular approach](#) in [percutaneous vertebroplasty](#) (PVP) is a well-established approach for the treatment of [vertebral compression fractures](#) (VCFs).

VCFs harbored 1.11% of unexpected malignancy. During the vertebroplasty, concomitant transpedicular vertebral biopsy is a safe and useful procedure for distinguishing non-malignant from malignant compression fractures, especially in diagnosing unsuspected malignancy ¹⁾.

[Vertebroplasty](#) for medically refractory vertebral [compression fractures](#) (VCF) may offer sustained improvement in pain and function. The procedure is associated with low morbidity and mortality ²⁾.
