Es una enfermedad que ocurre en la infancia y niños pequeños (menor a 3 años) que presentan pápulas únicas o múltiples (amarillas, rojas, naranjas o marrones) de 4 a 20 mm en diámetro que puede aparecer en cara, nuca, tronco y en la superficie de las extremidades

Se presenta por igual en niños y niñas y la etiología es desconocida. El diagnostico se realiza mediante biopsia aunque las lesiones son patognomonicas.

El estudio anatomopatologico presenta la presencia de células gigantes de Toutan.
