A study aimed to evaluate the [predictive value](#) of metabolic parameters in preoperative non-enhancing [peritumoral regions](#) (NEPTRs) for [glioblastoma recurrence](#), using multivoxel hydrogen proton magnetic resonance spectroscopy ([Proton magnetic resonance spectroscopic imaging](#)). Clinical and imaging data from patients with [recurrent glioblastoma](#) were analyzed. Through co-registration of preoperative and post-recurrence MRI, they identified future tumor recurrence regions (FTRRs) and future non-tumor recurrence regions (FNTRRs) within the NEPTRs. Metabolic parameters were recorded separately for each region. [Cox](#) regression analysis was applied to assess the association between metabolic parameters and glioblastoma recurrence. Compared to FNTRRs, FTRRs exhibited a higher [Cho/Cr](#) ratio, higher [Cho/NAA](#) ratio, and lower [NAA/Cr](#) ratio. Both [Cho/NAA](#) and [Cho/Cr](#) ratios were recognized as risk factors in univariate and [multivariate](#) analyses ($P < 0.05$). The [Cox](#) regression model indicated that $\text{Cho/NAA} > 1.99$ and $\text{Cho/Cr} > 1.73$ are independent risk factors for early glioblastoma recurrence. Based on these cut-off values, patients were stratified into low-risk and high-risk groups, with a statistically significant difference in [recurrence](#) rates between the two groups ($P < 0.01$). The [Cho/NAA](#) and [Cho/Cr](#) ratios in NEPTRs are independent predictors of future glioblastoma recurrence. Specifically, $\text{Cho/NAA} > 1.99$ and/or $\text{Cho/Cr} > 1.73$ in NEPTRs may indicate a higher risk of early [postoperative](#) recurrence at these regions ¹.
